This paper: labels, splits, detectors, diagnosis

Findings

RQ1-RQ2
RQ3
RQ4
RQ5

detection degrades under source shift; the fabrication labels lose two to three times the AUC
base rate alone, with no report text, gives 70-73% of the fabrication signal against 13% on omission
grounding recovers binary detection; entailment does not close the omission gap
panel labels track report length; each source LLM gets its own pair of judges
